Description

UV disinfection inactivates bacteria - essential for misting or fogging systems in public areas.

Where water particles can be inhaled, or where water quality is not to the required standard, UV inactivates potentially harmful microorganisms by altering their DNA structure. The system is very economical and does not produce any chemical by-products.

A 5 micron pre-filter is required, and lamps must be changed every 12 months. Sediment cartridge life will depend on the number of particles in the water.

- UV light destroys bacteria naturally
- Visual and audible alarm
- Digital lamp life display
- Easy installation

Water Treatment - UV System
