Single Station Controllers - EPAGD/T

Bluetooth Controllers - EPAGBT/EPAY04

Multi-Valve Controllers - EPAG01/DC4

UNDERGROUND VALVE CHAMBER

HUNTER TAP MANIFOLD (up to 12 zones)

GALCON TAP MANIFOLD (up to 4 zones)

Description

The simplest form of irrigation control is turning the tap on and off, however manual irrigation control is subject to forgetfulness and wasted water; in addition, it is generally accepted that the best time to water is dawn, when most people are in bed.

Control equipment ranges from simple single zone controllers to sophisticated multi zone controllers with mini weather stations, we now sell controllers with Bluetooth technology for remote programming from the app available on most android or apple devices. For small systems a battery operated timer can be fitted to the tap, turning the system on and off several times a day. These are ideal for small hanging basket drip systems.

Different areas will need separate control zones to ensure each planting type receives the correct amount of water. Borders can be watered every couple of days, whereas planters will require water several times a day. Zoning also makes efficient use of the available water. A large lawn, for example, could be watered as one zone, but would need large diameter pipes and a very high flow of water. By dividing the lawn into several zones, pipe sizes and water requirements are made more manageable.

Control System Watering - Domestic
