Description

Discreet and effective lawn watering uses quality, gear driven pop-up sprinklers, which are installed in the lawn using underground pipework - making the system invisible when not in use. Regular watering is important in areas of heavy use, allowing the grass to recover even during dry weather. Access lawn watering sprinklers are chosen from a range of types and sizes to ensure even water distribution for every conceivable lawn shape or size.

The new MP rotator spray head provides an even precipitation rate with low water consumption and is ideal for small to medium sized lawns.

The lawn watering can be controlled using battery or mains powered controllers, with optional weather sensitive over ride. Pump and tank sets can be provided to ensure adequate flows and pressures to operate the system.

Pop-up Watering
